Use Case: Landing Page

Iteration: 1

Primary Actor: User

Goal in Context: The initial start-up page, where the user is able to select whether to login or sign-up. Users are greeted by the landing page which includes the graphics elements and various details about the program, giving a snippet of the user experience. Users are able to browse through the program functions, however to proceed to the player profile, users must login or sign up with a new account.

Preconditions:

1. Users must have necessary files to be able to access the program, either by running the program through an integrated development environment, or through an executable.
2. Users must have an input medium such as a physical or virtual keyboard to be able to interact and enter necessary details.
3. Users must have an output medium such a monitor or screen to be able to see results created by the program.
4. Users must have a running machine, that means program requirements. **[Will be updated as the program is developed and published].**
5. Users must not change the contents of files, unless told otherwise by system prompts.
6. Users must make sure the machine is connected to the necessary connections, i.e. hosted network.

Trigger: Using an input medium the user launches the program either by running it through the integrated development environment, or through an executable.

Scenario:

1. Users download the necessary files through a verified shared domain platform (Gitlab or other sharing website).
2. Users read the README content to familiarize themselves with the program and its various functionality.
3. User ensures the current machine has met the specifications as laid out in the introduction documentation.
